

CSE 491 — Supervisor Meeting Form

Project title	NutriScan: Evidence-based food ingredient and health-condition matching	Meeting no.	1
Group members (name, no.)	Levent Can Ceylan (20220808045); Şükran Hilal Hocaoglu (20210808005); Ozan Karadaş (20220808007)	Project supervisor	Res. Asst. Dr. Taha Yiğit Alkan
Date / duration	02.10.2026 / [DURATION] min	Attendees	Levent Can Ceylan; Şükran Hilal Hocaoglu; Ozan Karadaş
Next meeting date	09.10.2026	Supervisor's assessment	☐ Insufficient ☐ Adequate ☐ Good ☐ Very good

Work completed since the last meeting	- Presented the initial concept (a household meal and shopping planning assistant with per-member allergen and health checks), an interactive prototype and the team's working setup (repository, task board, backend skeleton). - Presented a literature-based approach to health condition–ingredient matching and candidate data sources: FooDB (food compounds), JECFA (additive names and safety evaluations) and CTD (chemical–disease evidence); SapBERT for terminology matching and Qdrant for vector search.
Issues, risks and blockers discussed	- Disease–ingredient relationships need evidence-backed sources and a clear evidence strength; the presence of an ingredient alone does not establish a personal, dose-related risk. - Source coverage, identifiers, Turkish synonyms, units and conflicting or indirect evidence may differ between sources. Clinical thresholds and user-facing claims stay unconfirmed until their source and applicability are checked. - OCR quality on Turkish packaging (fonts, curved surfaces, E-number formats) and mapping label terms to standard ingredient names.
Decisions and action items (with owner and due date)	- Supervisor feedback: the planning-assistant scope is not distinct enough and would reduce to scanning a product and seeing a result. The project is re-scoped. - New core: evidence-based matching between health conditions and food ingredients, and communicating the result to users correctly and with its uncertainty. - Barcode scanning is dropped. The ingredient list on the package is read with OCR and matched against condition–ingredient evidence to conclude whether the product is suitable for the user. - The project must be defensible with literature and show a novel approach that does not exist in current products. - Action items for the next meeting (due 09.10.2026): see the plan below.
Plan until the next meeting	- Competitor analysis: the five closest products/studies; verify that none performs health condition–ingredient matching as proposed (Levent). - Condition list and literature basis from the referenced sources (Ozan). - Excel dataset with linked sheets for conditions, ingredients/compounds and evidence-based condition–ingredient relationships: Turkish and scientific names, source identifiers, product-label aliases, evidence type, citation/URL, access date, curation status (Hilal: evidence and source verification; Levent: workbook integration). - Turkish translation of the collected terms and labels; uncertain or unsupported links flagged for supervisor review. - Revised project definition (problem, approach, literature basis, scope) for supervisor review. - No clinical risk levels or dose thresholds are assigned without a verified source.
